

Story from the field

Bryant-Denny Stadium is home to the University of Alabama's football team. In the Spring of 2009 construction began to expand the south end zone with the addition of 1,700 seats and 36 skyboxes. When the architects, engineers and contractors began to take a look at water and fire protection, they chose HOLDRITE® HydroFlame™.

"HydroFlame provided optimum protection against water intrusion and fire stopping all at once," says Pat Sanders, HOLDRITE® Sales Representative. "Plus, HydroFlame was used in the building of the dorm rooms, and resulted in a superior solution and faster installation."

HOLDRITE® HydroFlame's™ patented mid-body seal provides the industry's first and only firestop sleeve device that ensures water tightness both inside and outside of the sleeve. This is accomplished without the need for accessories or field modifications. Combined with its easy installation, the HydroFlame cast-in-place sleeves are the ideal solutions for safeguarding property and protecting lives.
